Spring 2020

Shark®

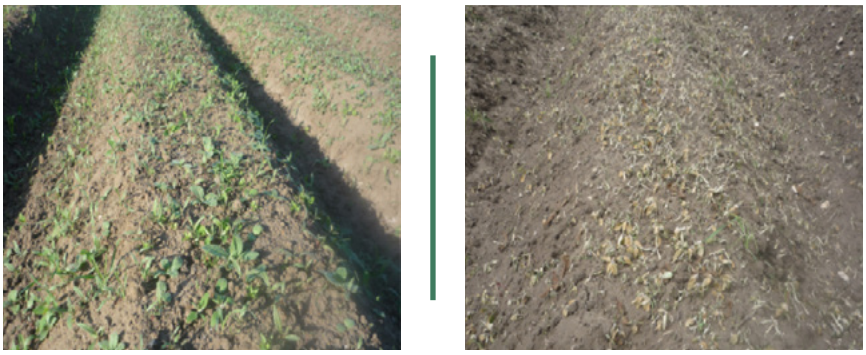

The contact broadleaved weed herbicide for use in potatoes

Shark®, containing the active ingredient carfentrazone-ethyl, is a fast-acting broadleaved weed herbicide for use in potatoes before emergence. This contact acting herbicide has excellent activity on a wide range of weeds including polygonum species, fathen, volunteer oilseed rape, cleavers and annual nettle. Shark is a highly flexible product as it is rainfast in 1 hour and is compatible with all residual potato herbicides allowing effective control in the potato crop before weeds start to compete.
