

Container cultivation

Practical, efficient, and cost effective

It is easy to understand why container cultivation of blueberries and other soft fruits is fast becoming a popular option for growers. A container-grown option gives you the flexibility to customise your own production facility anywhere, developing and maintaining optimal soil conditions, whilst attaining a higher yield.

Pasquini & Bini have a comprehensive range of pots specifically designed to maximise drainage and oxygen uptake to maintain healthy roots and plant vigour, while the legs of the pots prevent root contact with the soil beneath and the pathogens it may hold.

Growing blueberries and other soft fruit in pots is ideal as the soil can be chosen to suit their needs and the planters moved to a sheltered location out of season, thus protecting them from the worst of the winter weather.

Growing in pots means:

- Excellent pH control
- Healthier root system with greater yield
- Humidity & stagnation control
- Fertiliser & nutrient control
- Less environmental impact regarding chemical use

The ERACLE Range

Pasquini & Bini's ERACLE range is the result of years of research and observation of the growth of plants in containers and has been designed for the health of the root system.

The sides of the pot are designed to prevent circular root growth while the bottom feet distance it from the ground to ensure a perfect combination of air and water.

ERCOLE and DRACO range

This range of pots have a specially designed air system built into the walls and bottom of each pot which helps to:

- Reduce the growth time of the plant
- Ensures roots are self-pruning preventing spiralization
- Allows the right degree of humidity to enter the plant
- Better oxygenation and drainage
