

Natutec Airobreez

Information Sheet

Natutec Airobreez

Use the Airobreez for the distribution of biological controls in your crop. The Airobreez can be used for both full-field distribution and for specific hot spots.

- Uniform distribution of biological controls
- More efficient than manual application
- No impact on the quality of the biological controls

Volume of dosing pot/drum: 3.5 litres

Range: 0-4 metres.

FARGRO CODE: AIRO

More than biological control: Practical applications for everyday crop management

Developed by Koppert for the accurate distribution of biological controls, the Natutec Airobreez has also proven to be a highly effective tool for a range of everyday nursery and propagation tasks.

Its gentle airflow, consistent output and easy handling make it ideal for applying lightweight materials where speed, uniformity and control are essential.

Efficient Fertiliser Application

The Airobreez offers a fast, consistent way to apply granular and fine fertilisers across a wide range of growing systems.

It is particularly effective for:

- Top dressing 9cm pots
- Even distribution across propagation trays
- Treating large batches of plants quickly and uniformly

The controlled airflow helps prevent clumping and uneven coverage, ensuring each plant receives a consistent application. This reduces waste, improves accuracy and saves valuable labour time during busy periods.

Uniform Cork and Top-Dress coverage

The Airobreez can also be used to apply cork and other lightweight top-dress materials quickly and evenly.

Ideal for:

- Informal coverage of container-grown crops
- Creating a clean, professional finish
- Supporting moisture retention and weed suppression

The gentle delivery system allows cork to be spread without disturbing compost or young plants, helping maintain crop quality while improving presentation.

Uniform cork coverage.

A flexible tool for Growers

By extending its use beyond biological control, the Airobreez becomes a versatile, multi-purpose applicator that supports:

- More efficient workflows
- Reduced manual handling
- Consistent results across different tasks
- Better use of staff time

From biological control to fertiliser application it offers growers a practical way to streamline routine crop management with one reliable device.
